

nemco metals

your non-ferrous
metal
service centre

Established in 1974, Nemco Metals International Ltd has grown into the leading UK non-ferrous metal service centre.

Our processing facility specialises in high quality strip, sheet, tube and rod; performing 'post mill' operations including slitting, traverse winding and cutting-to-length on a wide range of semi-finished, metal products.

As part of the multinational Wieland Group, we benefit from access to the latest research and technology and to other group resources. Add to this, our policy of continual investment and we guarantee exceptional in-house capabilities.

Discover more about the Nemco approach to quality and service and how our business can help with your business.

Nemco Metals operates a Quality Management System approved to ISO 9001:2008.

Strip in coil

Nemco's extensive range of Copper and Copper alloys are expertly processed to your specification and managed by advanced computer programs.

We can produce quality strip sizes from 800mm down to 2mm wide with a thickness range of between 0.08mm and 3.00mm.

Saw

During 2010 we introduced an automated band-saw for cutting down our solid and drawn bar products. Full lengths can now be cut to as little as 9mm with a tolerance of just +/- 0.25mm.

This applies to dimensions ranging from 10mm up to 260mm. Further information is available upon request.

Traverse winding

Traverse winding involves joining several coils into one continuous, dimensionally accurate length, then precision layer winding this onto spools or drums. This is a particularly effective way of providing longer strips to enable machines to be kept running for much longer and with less supervision than would be possible with individual coils. We can traverse wind a wide variety of materials including Aluminium, Steel, Nickel Silver, Phosphor Bronze, Copper and Brass.

Contract slitting

In addition to producing our own products, Nemco offers sub-contracted processing of customers' own materials. Our machines are designed to cope with a wide range of both ferrous and non-ferrous materials and offer maximum flexibility of coil weights and inside diameters.

Quality management

Our customers demand consistent quality. All orders are fully certified to the required specification, and repeat orders will precisely match the original. Nemco's quality can be seen not only in our delivered products but on site, too. You are welcome to visit our Northampton factory, inspect our facilities and see for yourself that we deliver what we promise.

Nemco is known for the quality of its copper and copper alloys and other non-ferrous metal products in sheet, strip, tube, rod and wire. Our customers are varied, including the automotive, electrical, construction, heating and cooling industries. In fact anywhere where high-quality semi-products are demanded.

The combination of specialist support from the Wieland Group, plus our own attention to detail, ensures we can meet the most stringent technical and quality demands of today's manufacturer.

Drawn Profile & Sections

The effective use of sections and profiles result in less costly production methods, in addition scrap is minimised and ancillary costs are lowered. Shape and dimensions of the profile cross section are usually defined in a drawing.

Drawn Rod

Nemco's alloy rod and sections are produced to the highest precision standards meeting the most modern requirements for fast machining, low tool wear and automated production.

Cut-to-length

The introduction of our new automated band saw allows standard three metre drawn bar lengths to be cut to precision shorter lengths.

Tube

Nemco supplies copper tubes in straight lengths, level wound coils (Cuproclima) and as high-performance finned tubes for heating/cooling systems.

Scrap

Copper and copper alloys are materials which can be recycled without any loss in quality. Our recycling policy aims to conserve resources for the benefit of our environment and to provide the best possible service and price to all our customers.

We provide specialist recycling bins which can be collected either with each new metal delivery or by specific arrangement. The ability to contra any outstanding credit against customer accounts also allows for improved cash-flow.
